

AI-Powered Marketing Content Operations Workflow PRD (PDF-ready v1)

From Campaign Brief to Multi-Channel Asset Generation, Review, and Performance Feedback

This document is a portfolio-facing PRD. Sample scenarios and metrics are used to explain product logic and do not represent actual commercial campaign results.

1. Product Overview

This project explores how AI can be embedded into enterprise marketing content production workflows. The product is designed for recurring campaign scenarios such as new product launches, promotional campaigns, channel operations, and social content distribution.

It is not positioned as a one-click image generation tool or a replacement for designers. Instead, AI acts as an orchestration layer across the content production workflow: structuring vague campaign requests, generating creative directions, adapting content for multiple channels, identifying brand and compliance risks, and feeding campaign results back into reusable organizational assets.

Product Name

AI-Powered Marketing Content Operations Workflow

Product Positioning

A workflow product that helps marketing, content, design, brand, and compliance teams move from a vague campaign request to structured brief, creative direction alignment, multi-channel asset preparation, brand review, launch approval, and performance feedback.

Design Goals

1. Improve the quality and completeness of campaign briefs.
2. Reduce rework caused by unclear creative direction and inconsistent channel requirements.
3. Improve control over brand tone, risky expressions, and compliance-sensitive claims.
4. Turn campaign results into reusable assets, rules, templates, and bad cases for future campaigns.

2. Problem Context

Enterprise marketing teams often need to produce multiple content assets for the same campaign: website banners, social covers, article hero images, ad creatives, e-commerce graphics, store posters, and localized versions.

The bottleneck is rarely just “design production speed.” More often, the real friction comes from unclear input, misaligned creative direction, fragmented version management, late-stage brand review, and poor knowledge reuse after launch.

Key Pain Points

- 1. Incomplete campaign briefs**
Initial requests often lack audience definition, value proposition priority, channel objectives, constraints, and review requirements.
- 2. No intermediate creative direction layer**
Teams often move directly from brief to visual output, which makes direction-level issues visible only after significant design work has already been done.
- 3. Fragmented multi-channel adaptation**
Website, social, article, and ad channels each require different copy length, CTA, tone, layout, and risk treatment. Versions are difficult to manage consistently.
- 4. Brand review and campaign learnings do not compound**
Review comments remain one-off feedback, while campaign performance data rarely updates the next brief, rules, or generation strategy.

Figure 1: Traditional Marketing Content Production Pain Points

3. AI-Enabled Workflow

AI is embedded into the existing content production workflow rather than introduced as a separate generation tool.

AI Roles

AI Role	Capability	Problem Solved
Brief Structuring Assistant	Turns a vague request into audience, value proposition, channel, and constraint fields	Incomplete input
Creative Direction Assistant	Generates multiple strategic directions and channel-fit suggestions	Direction-level rework
Multi-Channel Adaptation Assistant	Produces channel-specific copy, CTA, visual guidance, and risk notes	Fragmented channel adaptation
Brand Risk Screening Assistant	Detects banned terms, exaggerated claims, unconfirmed benefits, and channel risks	Uncontrolled AI output
Performance Feedback Assistant	Summarizes performance signals and extracts reusable learnings	Learnings not reused

Figure 2: AI-Enabled Marketing Content Workflow

AI handles structuring, ideation, adaptation, screening, and summarization. Humans retain ownership of business goals, creative judgment, brand decisions, compliance review, and launch approval.

4. Product Evolution: V1 / V2 / V3

The product is not designed as a feature-heavy AI generation tool from day one. It evolves from input standardization to production coordination, and finally to governance and feedback loops.

Figure 3: Product Evolution

5. Core Product Design

5.1 Design Principles

1. Structure input before generating output

If the brief is unclear, faster AI generation may simply create faster rework.

2. Align creative direction before producing channel assets

Creative direction acts as an intermediate decision layer before design and content production.

3. Bind generation with review

Every generated channel version should retain status, risk level, revision records, and human review history.

4. Feed performance back into the system

Campaign results should update libraries, templates, and rules rather than remain in isolated reports.

5.2 Campaign Brief Structuring

AI turns a one-line request into a structured campaign brief, including:

- Campaign objective;
- Target audience;
- Value proposition priority;
- Channel and deliverable list;
- Content constraints;
- Review requirements;
- Missing information prompts;
- Risk fields.

Example input:

A new product launches next week. We need a set of youthful marketing assets highlighting lightweight design, battery life, and multi-scenario usage, for website banner, social cover, article hero image, and paid ads.

AI identifies missing information such as target audience, value proposition priority, public availability of parameters or benefits, channel requirements, and prohibited expressions.

5.3 Creative Direction Generation

AI generates multiple strategic directions before final assets are produced.

Direction	Strategy	Suitable Channels	Risk Note
Lightweight Freedom	Emphasizes freedom and low burden from lightweight design	Website banner, social cover	Avoid implying a specific weight claim
Scenario Companion	Shows the product across daily usage scenarios	Social, article content	Too many scenarios may dilute focus
Conversion-Oriented	Highlights launch and CTA	Paid ads, landing page	Weak conversion if benefits or pricing are unconfirmed
Brand Image	Uses restrained brand language	Website banner, article hero	Lower conversion intensity

5.4 Multi-Channel Version Management

Once a main direction is selected, the system generates and manages channel-specific versions.

Channel	Asset	Direction	Example Title	Status	Risk Level
Website	Banner	Lightweight Freedom	Go further with a lighter experience	Live	Low
Social	Cover	Scenario Companion	Commute, work, move — feel lighter through the day	Pending Review	Medium
Article	Hero Image	Scenario + Brand Image	New launch: lightweight experience for city life	Approved	Low
Paid Ad	Ad Creative	Conversion-Oriented	New launch: discover the lightweight experience	Draft	High

5.5 Brand Review and Risk Screening

AI screens generated content against brand tone, prohibited expressions, unverified claims, benefit-related language, and channel rules.

Example issues:

Channel	Risky Expression	Risk Level	Issue	AI Suggestion
Social	All-day comfort with no burden	Medium	Absolute experience claim	Make it softer and less absolute
Website	Battery lasts all day	Medium	Implies specific battery performance	Use scenario-based wording instead
Article	Industry-leading lightweight experience	High	Unsupported comparative claim	Remove “industry-leading”
Paid Ad	Reserve exclusive launch benefits now	Medium	Benefit mechanism unconfirmed	Use “Learn more” CTA

5.6 Performance Feedback and Learning Capture

After launch, the system connects campaign performance, version history, review decisions, and human feedback. Reusable learnings are extracted into:

- High-performing asset library;
 - Bad case library;
 - Brief template updates;
 - Brand / risk rule base.
-

6. Human-AI Collaboration Boundary

Marketing content production involves brand perception, compliance risk, customer expectations, and commercial claims. The system therefore follows the principle: **AI assists; humans remain accountable.**

Figure 4: Human-AI Responsibility Split

Key decision points require human confirmation, especially creative direction selection, brand review, compliance-sensitive claims, benefit-related language, and final launch approval.

7. Key Prototype Screens

The product is represented through five core screens that cover the full workflow from request intake to feedback capture.

The following screenshots are English-localized prototype screens used to show the product shape and workflow. All sample UI data is illustrative only and does not represent real campaign results.

Figure A: Brief Structuring

Brief Structuring

Page value: Turn vague campaign requests into structured input to reduce creative and design rework.

New Product Launch Multi-Channel Campaign

Brief Structuring · From vague requests to an actionable Campaign Brief

Brief Completeness 82/100

Pending Confirmation

Campaign Goals

AI Output

- Increase product awareness and preference
- Drive launch-period reservations and initial conversion

Target Audience

AI Output

- Urban commuters and light-sport users aged 20-35
- Young professionals
- Interested in lightweight design, battery life, and multi-scenario usage

AI Follow-ups & Risk Alerts

AI Output

Missing Information

- Has the reservation mechanism been confirmed?
- Have channel size specs been uploaded?
- Can pricing and benefits be disclosed?

Recommended Follow-ups

- What is the one value users should remember first?
- Should social content focus on awareness or conversion?
- Do paid ads need explicit pricing or benefits?

Risk Fields

- Avoid absolute wording for battery, weight, and comfort claims
- CTA involving reservation, benefits, or price requires human confirmation

Value Proposition Priority

AI Output

Priority	Value Proposition	Expression Strategy
P0	Lightweight Wear	Emphasize comfort and low burden during extended wear
P1	Long Battery Life	Cover commute, work, and movement across the day
P2	Multi-Scenario Usage	Use daily-life moments to show product companionship

Channels & Deliverables

AI Output

Channel	Deliverable	Content Focus
Website	Homepage Banner	Brand image, core value propositions, reservation entry
Social	Cover image + social headline	Scenario feel, lifestyle, lightweight experience
Article	Header image + article first screen	Launch information and core value explanation
Paid Ads	Ad image + short copy	Click conversion, benefit point, clear CTA

Content Constraints

Human Confirmation

- Avoid absolute claims such as "lightest", "all-day battery", "no burden", or "industry first"
- Specific weight and battery parameters are not public yet
- Pricing and benefits require human confirmation
- Tone should stay clean, restrained, youthful, and credible

New Product Launch Multi-Channel Campaign

Creative Direction Selection · Align on strategy before asset production

4 Directions Generated

Pending Selection

Brief Summary

Target Audience

Commuters and light-sport users aged 20-35

Core Value Props

Lightweight Wear / Long Battery Life / Multi-Scenario

Main Channels

Website / Social / Article / Paid Ads

Constraints

Parameters and benefits need human confirmation

Direction 1

Lightweight Freedom

Strategy: Emphasize freedom and low burden from lightweight design

Go further with a lighter experience

Lightweight design for seamless commute-to-movement switching

Urban commute

Morning light

Lightness

Freedom

Best Channels: Website banner, social cover

Risk: Avoid implying a specific weight claim

Direction 2

Scenario Companion

Strategy: Show the product across commute, work, movement, and daily life

From morning commute to evening routine

Lightweight wear across commute, work, movement, and downtime

Subway

Office

Workout

Evening routine

Best Channels: Social, Article

Risk: Too many scenarios may dilute focus

Direction 3

Conversion-Oriented

Strategy: Highlight launch action and click-through intent

New launch, discover the lightweight experience

Explore product highlights and reservation details

Product close-up

Info hierarchy

Reservation CTA

Best Channels: Paid ads, website reservation entry

Risk: Benefits and pricing require confirmation

Direction 4

Brand Image

Strategy: Express product attitude through restrained brand language

Make everyday moments feel lighter

A lightweight product experience for urban life

Minimal product shot

White space

Soft lighting

Best Channels: Website banner, article header

Risk: Lower conversion intensity

Direction Comparison

Human Confirmation

Direction	Best Goal	Best Channels	Conversion	Brand Safety	Visual Complexity	Risk
Lightweight Freedom	Awareness + Preference	Website / Social	Medium	High	Medium	Weight claim
Scenario Companion	Social engagement	Social / Article	Medium	High	High	Diluted focus
Conversion-Oriented	Reservation clicks	Paid Ads / Website	High	Medium	Low	Unconfirmed benefits
Brand Image	Brand attitude	Website / Article	Low	High	Low	Weaker conversion

AI Recommended Mix

- Website: Lightweight Freedom
- Social: Scenario Companion
- Paid Ads: Conversion-Oriented
- Website visual reference: Brand Image

Regenerate Directions

Add Human Note

Confirm Main Direction

Generate Channel Versions

Figure C: Multi-Channel Version Management

Figure D: Brand Review

Figure E: Performance Review

Screen	Product Problem	AI Entry Point	Human Confirmation
Brief Structuring	Brief lacks audience, value proposition, channel, and constraint details	Structured brief, missing info prompts, risk fields	Marketing/business confirms before next step
Creative Direction Selection	Teams jump into asset production before direction alignment	Multiple strategic directions and channel-fit suggestions	Marketing, design, and brand select main direction
Multi-Channel Version Management	Channel versions are fragmented and hard to manage	Channel-specific versions, adaptation rationale, risk notes	Owner edits and submits for review
Brand Review	AI output may contain brand deviation or risky claims	Risk expression screening and rule matching	Brand, legal, or business owner confirms
Performance Review	Campaign learnings do not feed future production	Performance summary and bad case extraction	Human confirms updates to libraries and rules

8. Feedback Loop and Organizational Asset Capture

The product does not treat performance review as a standalone report. Instead, performance signals and review decisions are captured as reusable organizational assets.

Figure 5: Feedback Loop and Asset Capture

Each campaign becomes a source of better input for the next campaign: successful patterns enter the asset library, poor-performing versions enter the bad case library, repeated risky expressions update the rule base, and missing fields improve future brief templates.

9. Pilot Strategy

The product should not start by covering all campaign types. It should begin with high-frequency, lower-risk, repeatable scenarios with relatively clear rules.

Recommended Initial Scenarios

- Promotional banners;
- Social and article covers;
- Paid ad copy and creative drafts;
- E-commerce campaign graphics;
- Store marketing materials;
- Multi-language / localized channel adaptation.

Not Recommended for the First Pilot

- Core brand films;
- High-budget master campaign visuals;
- Major product launch hero visuals;
- Highly regulated or legally sensitive claims;
- Campaigns that rely heavily on creative director-level judgment.

Pilot Stages

1. Validate brief structuring value

Measure brief completeness, follow-up questions, direction mismatch, and user satisfaction.

2. Validate multi-channel adaptation value

Measure version creation time, manual revision ratio, status clarity, and usability by designers.

3. Validate review and feedback-loop value

Measure review pass rate, risk detection quality, repeated issue reduction, and number of reusable assets or bad cases captured.

10. Product Value

Business Value

- Improves campaign brief quality;
- Reduces communication and rework costs;
- Improves multi-channel production efficiency;

- Improves brand consistency;
- Reduces compliance and review risks;
- Feeds performance insights into future content production.

Organizational Value

- Turns scattered content production experience into reusable assets;
- Converts static brand guidelines into callable rules;
- Converts review comments into rule updates;
- Converts performance reports into future generation context;
- Turns one-off campaign delivery into a continuously improving workflow.

AI Product Design Value

- Starts from business workflow rather than tool functionality;
- Defines where AI should assist and where it should not replace human judgment;
- Designs human-in-the-loop review and governance mechanisms;
- Connects generative AI with enterprise rules, brand assets, historical cases, and feedback loops;
- Turns one-off generation tasks into a traceable, reusable, and optimizable workflow.

11. One-Sentence Summary

This project designs an AI-powered marketing content operations workflow that turns campaign requests into structured briefs, creative directions, multi-channel content versions, brand-reviewed outputs, and reusable feedback assets — upgrading AIGC from a single-point generation tool into an enterprise content production and governance mechanism.

Appendix: PDF-ready v1 Update Notes

Compared with the previous English PRD markdown, this version mainly updates:

1. Inserts five English-localized prototype screenshots for portfolio-facing PDF export;
2. Keeps the PRD structure concise while making the product form visible;
3. Preserves Mermaid-based workflow diagrams for document-style presentation;
4. Uses image assets packaged together with the markdown for easier PDF generation.
